

**They can live
in extreme places,
such as boiling water,
the barren desert and
extremely salty lakes.**

Microbes are living creatures
that digest your meals.
Digestion can't just happen
by itself!

A large, abstract background composed of various blue brushstrokes of different shapes and sizes, creating a textured, painterly effect. The strokes are layered and overlap, with some being more prominent than others.

Microbes, however, can also make
the Earth a better place to live.

As you know, plastic waste is a
growing problem for our planet,
and microbes may offer an
organic solution.

A colorful necklace made of various microbe-shaped beads. The beads are in shades of red, yellow, green, and blue, and have different shapes: some are round, some are elongated, some have spiky protrusions, and some are more complex, resembling bacteria or viruses. The necklace is arranged in a loose, winding pattern across the bottom half of the page.

Some of them can be used
to make biodegradable
plastics that won't pollute
our environment and can
be recycled and broken
down by nature itself.
